EXPLANATORY NOTE

The presentation of vital and health statistics for India, for the years 1948 and 1949, in this publication very closely follows the pattern adopted in the Statistical Appendices (Part I) to the Annual Report of the Director General of Health Services for the year 1947. Similar statistics for years prior to 1947 were published in the Statistical Appendices to the Annual Report of the Public Health Commissioner with the Government of India.

During the year 1948, certain smaller States were merged into the adjoining major ones. The States affected by such integration are Bombay, Madras, Orissa, Madhya Pradesh (formerly Central Provinces and Berar) and Uttar Pradesh (formerly United Provinces). Newly added areas were formerly parts of the princely States and many of them did not have adequate arrangement for registration of vital statistics. In compiling the various tables in this publication in respect of the year 1948 the vital and health statistics in respect of the population residing in the newly added merged areas have, therefore, been excluded. Even for the year 1949, information regarding the merged areas is available for the States of Madras and Bombay only. In Madras the addition of merged area, in square miles, is about one per cent of the total area of the State whereas in Bombay there has been about 40 per cent increase in the total area. It will, therefore, be seen that in Madras there has been a very little difference in the figures for the years 1948 and 1949, whereas the figures pertaining to the reported births and deaths in respect of the State of Bombay for the years 1948 and 1949 show a big difference.

It need hardly be stressed that the system of reporting and registration of vital events and of diseases in this country is not satisfactory. It is, therefore, desirable that limitations inherent in the figures, mostly confined to under reporting, may be taken into consideration when interpreting these statistics. The general fall in death rate and the infant mortality rate noticed during recent years is really encouraging and may be ascribed to the progress in public health activities. It cannot be denied that, with the increased efforts, however slight, made by the State Governments to improve registration of vital statistics, under reporting is being minimised and therefore this appreciable fall in the mortality rates is significant. The reduction in the birth rate recorded in most of the States appears difficult to account for. It is easy to speculate that the increasingly difficult economic conditions might have had their share in making the people more conscious of the necessity for limiting the size of the families. It is equally probable, however, that industrialisation and consequent urbanisation, particularly in respect of male folk combined with shortage of housing accommodation for the workers and their families from 1946 onwards has had its effect on this rate.

Certain towns which recorded suspiciously high or low infant mortality rates have been omitted from the Table 14 in order to improve the quality of statistics in the publication. Similarly, vital statistics of a few States appeared to be of doubtful accuracy and have therefore not been included in Table 15. A table showing deaths recorded from different causes with the respective rates in regard to the smaller States was a feature in the Statistical Appendices for the year 1947 as also for the earlier years. Owing to the incomplete and uncertain nature of information received it was thought worthwhile to exclude presentation of this particular data.
